I INTRODUCTION

Installation manual

This Installation manual contains all the information required for installing and configuring the Expansion kit for all K18 Simplygas heat pump units (Gas Absorption Heat Pump) and K18 Hybrigas hybrid units (Gas Absorption Heat Pump and integrated auxiliary boiler module), in line with one of the standard system configurations also described in the document. The manual is a supplement to the System Controller Installation Manual; as such, it must be used in combination with the latter.

II SYMBOLS AND DEFINITIONS

II.1 KEY TO SYMBOLS

DANGER
WARNING
NOTE
PROCEDURE
REFERENCE (to other document)

II.2 TERMS AND DEFINITIONS

KECSK18 = expansion kit.
Siemens RV521.826 = control unit (electronic board).
CSK18 = System controller for K18 installed in the provided enclosure.
Siemens QAA75.611 = advanced room unit.
Siemens QAA55.110 = base room unit.
Appliance / Unit K18 = equivalent terms, both used to refer to K18 Simplygas or K18 Hybrigas unit type.
Auxiliary boiler = equipment (e.g. boiler) for the production of heat for space heating and/or DHW, able to integrate or replace the heat pump of the K18 unit. It is always found in the K18 Hybrigas type of unit and consists of an integrated boiler module, whereas it is optional in K18 Simplygas units, not necessarily supplied by Robur, and connected to the plumbing system outside the unit.
TAC = Technical Assistance Centre authorised by Robur.
DHW = domestic hot water.

III WARNINGS

This manual is an integral and essential part of the product and must be delivered to the user together with the appliance.

III.1 GENERAL AND SAFETY WARNINGS

Installer’s qualifications

Installation must exclusively be performed by a Qualified Firm and by Skilled Personnel, with specific knowledge of electrical systems, in compliance with the laws in force in the Country of installation.

Declaration of Conformity

Upon completing installation, the installing firm shall issue to the owner/client the appliance’s Workmanlike Conformity Declaration, according to national/local regulations in force and the manufacturer’s instructions/provisions.

Misuse

The appliance must only be used for the purposes for which it has been designed. Any other use is deemed hazardous. Incorrect use may affect operation, duration and safety of the appliance. Adhere to the manufacturer’s instructions.

III.2 MISUSE

Electrocution hazard

- Disconnect the electrical power supply before any intervention/work on appliance components.
- For electrical connections exclusively use compliant components and according to the specifications provided by the manufacturer.
- Ensure the appliance cannot be accidentally switched back on.

Earthing

Electrical safety depends on effective earthing system, correctly connected to the appliance and installed according to the regulations in force.

In the event of failure

Operations on internal components and repairs may
Warnings

exclusively be carried out by a TAC, only using original parts.
- In the event of fault of the appliance, do not attempt to repair and/or restore and immediately contact the TAC.

Keep the Manual

This "Installation, Use and Maintenance Manual" must always accompany the appliance and must be handed to the new owner or installer in the event of sale or removal.

The equipment must be installed indoors and out of the weather. For positioning, refer to the protection rating given in par. 2 of the K18 system controller Installation manual.

III.2 CONFORMITY

For the appliance’s technical and conformity data, refer to Appendix A p. 23 and Appendix A of the K18 system controller Installation manual.

III.3 EQUIPMENT

The Expansion kit KECSK18 (ODSP030) unit’s equipment includes:
- n. 1 Siemens AVS55.196 expansion board
- n. 1 Siemens AVS92.280 mounting plate
- n. 1 Siemens AVS82.496 ribbon cable
- n. 1 10 pole connector (green) marked X110
- n. 1 7 pole connector (red) marked X150
- n. 1 10 pole connector (grey) marked X152
There may also be n. 1 3 pole connector (green) marked X10, which is not used.
The above parts may also be supplied assembled or partly assembled together.

III.4 EXCLUSIONS OF LIABILITY AND WARRANTY

Any contractual or extra-contractual liability of the manufacturer for any damage caused by incorrect installation and/or improper use and/or failure to comply with regulations and with the manufacturer’s directions/instructions shall be disclaimed.

In particular, the warranty on the appliance may be rendered void by the following conditions:
- Incorrect installation/cabling.
- Misuse.
- Failure to comply with the manufacturer’s indications on installation, use and maintenance.
- Alteration or modification of the product or any part thereof.
- Extreme operational conditions or however outside of the operational ranges set forth by the manufacturer.
- Abnormal actions transmitted by the plant or installation to the appliance (electric shock, overheating, power surges, etc.)
- Accidental damages or due to force majeure.
GENERAL INFORMATION AND SYSTEM DIAGRAMS

The Expansion kit (KECSK18) of the System Controller for the models of the K18 family allows the system configurations supported by it to be extended. In particular, the addition of the kit allows the types of plumbing diagrams indicated in Figures 1.1 p. 6 and 1.2 p. 7 to be set up with regards to the K18 Simplygas unit and those indicated in Figures 1.3 p. 8 and 1.4 p. 9 to be set up with regards to the K18 Hybrigas unit.

The following diagrams intend to show the hydraulic configurations supported by System controller, including the parts to be connected to it. Ancillary hydraulic components (expansion tanks, safety valves, etc.) are only shown as a guide; for the detailed plumbing layout, refer to the handbook of the K18 range and to the specific installation manual of the K18 unit used.

**Figure 1.1** System with K18 Simplygas unit, primary water circuit only and three zones, auxiliary boiler and DHW production optionals

- **A** Unit K18 Simplygas
- **B** Auxiliary boiler (optional)
- **C** check valve (to be installed only in the presence of an auxiliary boiler)
- **D** External water pump (only for C0 versions)
- **E** By-pass section with overpressure valve
- **F** Room unit 1 (QAA75, 611)
- **G** Thermostats (with timer) for zones
Figure 1.2 System with K18 Simplygas unit, primary and secondary water circuits, up to three heating circuits, two of which are optionally mixed, auxiliary boiler and DHW production optionals

F  Room unit 1 (QA75.61)
G  Thermostats (with timer) for zones
Figure 1.4 System with K18 Hybrigas unit, primary and secondary water circuits, up to three heating circuits, two of which are optionally mixed, DHW production optional

For water circuits with a primary circuit only (fig. 1.1 p. 6 and 1.3 p. 8) water circulation must be
Assembly and installation

The Expansion kit for the K18 system controller is supplied complete with everything required for quick installation inside the CSK18 enclosure.

Before installing the unit, check that the equipment is not connected to its power supply.

The cabling must satisfy the requirements of safety class II, i.e. the mains power cables and the SELV cables must be ducted separately. Also, keep a distance of at least 50 mm between the ducts that contain mains cables and those which contain safety extra low voltage cables and between the two categories of cables inside the enclosure; achieve this by following the instructions provided in the Installation Manual of the System Controller with regards to the choice of the input holes in the enclosure to use for the mains connections and for the safety extra low voltage (SELV) ones. The CSK18 and any other equipment and accessories must be powered up only when the installation is complete. Failure to observe this instruction incurs a risk of electrocution and short-circuit.

The CSK18 must not be exposed to water.

The unit’s ambient operating temperature range is 0 °C - 50 °C.

2.1 INSTALLING THE EXPANSION KIT INTO THE CSK18 ENCLOSURE

Assembly and installation

1. As shown in fig. 2.1 p. 10, assemble the AVSS5.196 electronic board with the plastic mounting plate; push the six short retainers fully into the holes in the board until the pawls click.

2. Align the six long retainers on the bottom side of the mounting plate with the holes in the RVS 21.826 electronic board already present in the CSK18 enclosure, then push them in until they snap into place.

3. Push the connectors of the included AVS82.496 ribbon cable fully in the comb connectors marked X100, on the edge of the two electronic boards.

DO NOT remove the RVS21.826 board from the CSK18 enclosure.

Following installation of the KECSK18 expansion kit, the K18 system controller is automatically configured to facilitate the installation and commissioning of the types of circuit indicated in fig. 1.1 p. 6, 1.2 p. 7, 1.3 p. 8 and 1.4 p. 9. However, it can also support other configurations. For applications other than those indicated in this manual, Robur provides custom consultancy service.

The Expansion kit may also be supplied with the electronic board and mounting plate assembled together; in this case, go directly to the next step.

The Expansion kit may also be supplied with the ribbon cable already assembled to connector X100 of the...
AVS55.196 electronic board; in this case, insert the free connector into the RVS21.826 board.

Figure 2.3 Detail of ribbon cable connection between the two boards

4. If the expansion kit is supplied with the connectors not yet installed, fit the following into the corresponding sockets after having identified them:
   - 10 pole connector, green, X110
   - 7 pole connector, red, X150
   - 10 pole connector, grey, X152
   - even if it is included in the kit, DO NOT install the 3 pole green connector X10

If the expansion kit is supplied with the connectors already installed, pull out the 3 pole green connector X10.

5. Identify the 3 pole green connector X10 left free inside the CSK18 enclosure and fit it into the corresponding socket on the AVS55.196 board of the Expansion kit.
Assembly and installation

Electrical hookup

Figure 2.4 Layout of components and wiring diagram of system controller for K18 with expansion kit installed

Figure 2.4 p. 12 gives a schematic illustration (not to scale) of the layout of components inside the CSK18 enclosure with the Expansion kit installed.

The additional electrical connections, regarding the functions handled by the Expansion kit, are made on the included extractable connectors which fit directly into the kit’s AVS55.196 electronic board, as described in this manual.

On the other hand, unless otherwise expressly specified, for the functions available without the Expansion kit, refer to the system controller Installation manual.

Table 2.1 p. 13 lists the Line Voltage supply and signal connections on the extractable connectors on the left edge of the Siemens AVS55.196 expansion board. To identify the position of the connectors, refer to the wiring diagram given in fig. 2.4 p. 12.

To identify the plumbing system components and sensors corresponding to the Siemens function codes (e.g. Q6, Y5, Y6) refer to the plumbing system diagrams in fig. 1.1 p. 6, 1.2 p. 7, 1.3 p. 8 and 1.4 p. 9.

(1) Note that this function is also available when the expansion kit is not used. In this case, as indicated in the system controller Installation Manual, pump Q6 is hooked up to terminals QX3 and N on connector X12 of the RVSS1.826 electronic board. If using the expansion kit, on the other hand, follow the diagrams and instructions given in this manual.

(1) These terminals need not be used to connect additional room units. They can also be connected directly in parallel to the terminals of connector X86 of the RVSS1.826 controllers, or connected in cascade, as indicated in the system controller Installation manual and par. 3.1 p. 14 of this manual.

(2) Input H31 is open to keep heating circuit 3 inactive. If this heating circuit is present, fit a jumper between terminals H31 or insert an external request signal between them (voltage free contact).

The temperature sensors connected to the Siemens AVSS5.196 expansion board are of the NTC 10k (Beta 3977) type.
3 ELECTRICAL HOOKUP

3.1 HOOKING UP THE ROOM UNIT

Figure 3.1 Example of connection of three room units, one type QAA75.611, the others (optional) type QAA55.110

A  Grey connector X86 (bottom edge of RVS21.826 board)
B  Room unit 1 (QAA75.611)
C - D  Ambient units 2 and 3 (QAA55.110) (optional code ODS004)

NOTE  Use shielded signal cable 3x0.75 mm² (2x0.75 mm² for QAA55.110).
Maximum total length 400 m.
Maximum length between controller and room unit 200 m.
Both room units can also be connected to connector X86.

Table 3.1 QAA75.611 and QAA55.110 (optional) room unit connection

- B NO voltage free contact
- C3 Thermostat (with timer) for zone 3 (or circuit 3)

4 COMMISSIONING

This section gives supplementary information regarding system commissioning, which are required when using the Expansion kit. As previously, this section must be consulted in combination with the matching section of the system controller Installation manual.

It is assumed that the plumbing system and electrical installations have been completed and checked in compliance with sections 1 p. 6, 2 p. 10 and 3 p. 14 of this manual and the matching sections of the system controller Installation manual.

The K18 and auxiliary boiler (if present) may start during and at the end of commissioning. Make sure that the plumbing system is complete and filled with water.

Commissioning must be done by a TAC.

4.1 USING THE QAA75.611 ADVANCED ROOM UNIT’S INTERFACE

See the Paragraph 4.1 of the system controller Installation manual.

4.2 COMMISSIONING PROCEDURE

Proceed as indicated in to Paragraph 4.2 of the system controller Installation manual; when the system is powered up, also check that the green led on the AVSS5.196 expansion board lights up; if the led does not light up, check that you have connected the 3 pole connector, green, X10 to the socket on the expansion board and that the ribbon cable has been inserted into the comb connectors marked X100 on the RVS21.826 and AVSS5.196 boards.

4.3 FUNCTIONAL TESTS

These tests are not strictly necessary, however they allow you to quickly identify most problems with the electrical hookup and system anomalies; we strongly recommend running them.

4.3.1 Testing the inputs and outputs

1. Access the Commissioning menu level, select the Input/output test menu and select parameter 7700 (Relay test).
2. Set it to QX5 (QX5 relay output, function Q2 -> Heating circuit 1 pump) and check that the heating circuit 1 pump runs (or the zone 1 valve opens).
3. If heating circuit 1 is of the mixed type:
   - Set the parameter to QX1 (QX1 relay output, function Y1 -> open mixer valve on system outlet line) and check that the mixer valve responds as desired.
   - Set the parameter to QX2 (QX2 relay output, function Y2 -> open mixer valve on heating circuit 1 inlet line) and check that the mixer valve responds as desired.
4. If heating circuit 2 (or zone 2) is present:
   - Set the parameter to QX33 (QX33 relay output on AVSS5.196 board, function Q6 -> heating circuit 2 pump) and check that the pump of heating circuit 2 runs (or the zone 2 valve opens).
5. If heating circuit 2 is present and of the mixed type:
   - Set the parameter to QX31 (QX31 relay output on AVSS5.196 board, function Y5 -> open mixer valve on system outlet line) and check that the mixer valve responds as desired.
   - Set the parameter to QX32 (QX32 relay output on AVSS5.196 board, function Y6 -> open mixer valve on heating circuit 2 inlet) and check that the mixer valve responds as desired.
6. If heating circuit 3 (or zone 3) is present:
   - Set the parameter to QX35 (QX35 relay output on
AVSSS.196 board, function Q20 -> heating circuit 3 pump) and check that the pump of heating circuit 3 runs (or the zone 3 valve opens).

7. If the Domestic Hot Water function managed by the K18 unit is present (EVO models):
   - Set the parameter to QX4 (QX4 relay output, function Q3 -> set DHW diverter valve to DHW service) and check that the diverter valve responds as desired.

8. Now select parameter 7700 again and set it to No test.

9. Select parameter 7804 (Sensor temp BX1) and check its value (sensor BX1, function B9 -> external temperature).

10. If the Domestic Hot Water function managed by the K18 unit is present (EVO models):
    - Select parameter 7806 (Sensor temp BX3) and check its value (sensor BX3, function B3 -> DHW tank temperature).

11. If heating circuit 1 is of the mixed type:
    - Select parameter 7807 (Sensor temp BX4) and check its value (sensor BX4, function B1 -> Heating circuit 1 outlet temperature).

12. If heating circuit 2 is present and of the mixed type:
    - Select parameter 7973 (Sensor temp BX31) and check its value (sensor BX31, function B12 -> Heating circuit 2 outlet temperature).

To facilitate checking the connection of each temperature sensor to its input, you can take them out of their mounts one at a time and heat them up slightly; observe the variation of the readings on the display to check that they are hooked up to the right inputs.

Make sure you have restored each sensor to its own mounting afterwards!

13. If an external request signal is connected for heating circuit 1 (or zone 1), for example, with a thermostat or thermostat timer:
    - Select parameter 7844 (Input signal H1) and actuate the external signal’s contact to check that it switches as expected from open (indicated by o o o) to closed (indicated by o o o) and back.

    NOTE: If no external request signal is present, this test must indicate closed (o o o), due to the jumper installed at the factory.

14. If heating circuit 2 (or zone 2) is present, and an external request is hooked up:
    - Select parameter 7858 (Input signal H3) and actuate the external signal’s contact to check that it switches as expected from open (indicated by o o o) to closed (indicated by o o o) and back.

    NOTE: If no external request signal is present, this test must indicate closed (o o o), due to the jumper added during installation.

15. If heating circuit 3 (or zone 3) is present, and an external request is hooked up:
    - Select parameter 7989 (Input signal H31) and actuate the external signal’s contact to check that it switches as expected from open (indicated by o o o) to closed (indicated by o o o) and back.

    NOTE: If no external request signal is present, this test must indicate closed (o o o), due to the jumper added during installation.

16. Now select parameter 7700 (Relay test) and set it to Everything off.

17. Select parameter 7724 (Output test UX3) and set it to 50%

18. Access the terminal block of the K18 unit (refer to the "K18 unit connection to the CSK18 enclosure terminal block" Figure in Section 3 of the Installation manual of the System Controller):
    - Check that the DC voltage between the COM and DHW terminals is around 17 V.
    - Check that DC voltage between the 0 and +10 terminals of the K18 CONTROL CABLE terminals group is 5 V.
    - Check that the DC voltage between the COM and RES terminals is around 8.5 V.

19. Select parameter 7700 and set it to QX4.

20. Install a temporary jumper between the EXTERN RESET terminals on the CSK18 enclosure terminal block.

21. Access the terminal block of the K18 unit (refer to the "K18 unit connection to the CSK18 enclosure terminal block" Figure in Section 3 of the Installation manual of the System Controller):
    - Check the voltage between the COM and DHW terminals again: it should now be around 0 V.
    - Check the voltage between the COM and RES terminals again: it should now be around 0 V.

22. Set parameter 7700 to No test.

23. Select parameter 7724 (Output test UX3) and set it to - - - (test deactivated).

24. Press ESC twice to inlet to the start screen.

25. Remove the temporary jumper between the EXTERN RESET terminals on the CSK18 enclosure terminal block.

4.3.2 Checking the start and stop commands on the heat pump
Refer to par. 4.3.2 of the system controller Installation manual.

4.3.3 Checking the start and stop commands on the auxiliary boiler (if present)
Refer to par. 4.3.2 of the system controller Installation manual.

4.4 Setting the system to STAND-BY
Refer to par. 4.4 of the system controller Installation manual.
5 SETTINGS

This section gives supplementary information regarding the optimisation of the system settings, which are required when using the Expansion kit. As previously, this section must be consulted in combination with the matching section of the System controller Installation manual.

5.1 OPTIMISING HEATING SERVICE

5.1.1 Heating circuits (or zones) 1 and 2

Refer to Paragraphs 5.1.1 and 5.1.2 respectively of the System controller Installation manual.

<table>
<thead>
<tr>
<th>Table 5.1 Heating circuit 3 (or zone 3) preconfiguration (if present)</th>
</tr>

<tr>
<td>Room temperature limitation</td>
</tr>
</tbody>
</table>

To change the settings of Table 5.1, access the Engineer menu level, and then the Heating circuit 3 menu; then select the parameters indicated in Table 5.1 and modify them as desired.

5.1.3 Selecting the operating mode and time programming

Refer to par. 5.1.3 of the system controller Installation manual for the description of the operating modes and for the time programming of heating circuits 1 and 2.

For the time programming of heating circuit 3 (or zone 3) (obligatory if the circuit is running in Automatic mode), proceed as indicated in the preconfiguration paragraph of the system controller Installation manual, but using the Time prog heating/cooling 3 menu; in this case, use parameters 540 (Presel. heating/cooling 3 menu), 541 – 546 (period settings) and 555 (Copy).

5.1.4 Setting the heating curve slope and min/max outlet water setpoints

Refer to Paragraph 5.1.4 of the system controller Installation manual.

5.1.5 Setting the Room influence and Room temperature limitation parameters

Refer to Paragraph 5.1.5 of the system controller Installation manual for a general description of the Room influence and Room temperature limitation functions, as well as for the settings relating to heating circuits 1 and 2.

Controller Installation manual.

5.1.2 Heating circuit 3 (or zone 3) (if present)

This circuit (or zone) is preconfigured to be inactive; if present, it must be activated by adding a jumper or external request signal (e.g. zone thermostat or thermostat timer), as described in figure 3.6 p. 17.

Once activated, the preconfigured settings are those given in Table 5.1 p. 19.

Room influence function for heating circuit 3 (if present)

Heating circuit 3, if present, is preconfigured to use this function in relation to the included room unit 1 temperature reading, with a mild compensating action (20%), which is suited to many installations. To modify the degree of influence, or disable the function entirely:

▶ Select parameter 1350 as described in par. 5.1.2 p. 19 of this manual, and set the influence percentage (%), or - - - to disable the function entirely.

Setting a value of 100 % disables the heating curve. It is best not to use this setting, or even very high influence percentages. For most applications, do not exceed a setting of 30 %.

Room temperature limitation function for heating circuit 3 (if present)

Heating circuit 3 is preconfigured to use this function in relation to the temperature read by room unit 1 (included), with a value of 2.5 K (the service request is interrupted when room unit 1 reads a temperature 2.5 degrees higher than the setpoint). To change this setting or disable the function:

▶ Select parameter 1360 as described in par. 5.1.2 p. 19 of this manual, and set the desired value, or - - - to disable the function entirely.

5.1.6 Setting the building time constant

Refer to par. 5.1.6 of the System Controller Installation manual.

5.1.7 Choice of installation and use of room units

The system is supplied with a QAA75.611 room unit. The room unit is preconfigured as Room unit 1 to acquire the room temperature in a reference heated room served by heating circuit 1, and to influence the regulation of heating circuit 1 accordingly and, if present, also that of heating circuits 2 and 3 (as described in par. 5.1.5 of this manual and the System Controller Installation manual).
manual). This setting is suited to the following type of installation:

Case 1
- the included room unit is actually installed in a reference heated room.
- heating circuits 2 and 3 are not present, or additional room units dedicated to them are not to be installed.
- if at least one of heating circuits 2 and 3 is present: the reference room, served by heating circuit 1, is at least partly representative also for the rooms served by the other heating circuit/s.

You can adjust the parameters described in par. 5.1.5 of the System Controller Installation manual and par. 5.1.5 p. 19 of this manual to differentiate the settings for the various circuits, to the point even of disabling one or both of the room unit influence functions for heating circuits 2 and 3, which do not directly serve the reference room.

If, on the other hand, the situation is as follows:

Case 2
- the included room unit is not installed in a reference heated room, for example, it is in the machine room, in this case, one must configure the room unit so as not to provide the room temperature signal to the system. Proceed as follows:
  1. Access the Engineer menu level, then the Operator section menu.
  2. Select parameter 40 (Used as) and set it to Room unit 1.
  3. Still from the Engineer menu level, access the Configuration menu.
  4. Select parameter 6200 (Save sensors), set it to yes and confirm.

The value of parameter 6200 which displays at the end of the configuration procedure will still be no; this is normal (this setting executes an action, i.e. memorization of the actually installed sensors).

Finally, in the following situation:

Case 3
- one or both of heating circuits 2 and 3 are present
- additional room units have been installed, each dedicated to one of heating circuits 2 and 3, you must configure the first served by heating circuit 2 unit, installed in a reference room served by circuit 1, so that it is dedicated to that circuit.

Proceed as follows:

Working on the first room unit:
  1. Access the Engineer menu level, then the Operator section menu.
  2. Select parameter 40 (Used as) and set it to Room unit 1.
  3. Select parameter 47 (Room temperature device 1) and set it to Heating circuit 1 only.
  4. Select parameter 48 (Occupancy button device 1) and set it to Heating circuit 1 only.

You must now configure the second room unit, installed in a reference room heated circuit 2. Proceed as follows, depending on the type of room unit:

Second room unit type QA75.611
Proceed as follows, working on the second room unit:
  1. Access the Engineer menu level, then the Operator section menu.
  2. Select parameter 40 (Used as) and set it to Room unit 2.

Second room unit type QA55.110
Proceed as follows, working on the second room unit:
  1. Press the occupancy button  for at least 3 seconds, until the display reads ru = 1, ru = 2, or ru = 3.
  2. Turn the knob to set the parameter to ru = 2.
  3. Wait for the text ru = 2 to clear from the display.

If heating circuit 3 is present, you must now configure the third room unit, installed in a reference room served by such circuit. Proceed as follows, depending on the type of room unit:

Third room unit type QA75.611
Proceed as follows, working on the third room unit:
  1. Access the Engineer menu level, then the Operator section menu.
  2. Select parameter 40 (Used as) and set it to Room unit 3.

Third room unit type QA55.110
Proceed as follows, working on the third room unit:
  1. Press the occupancy button  for at least 3 seconds, until the display reads ru = 1, ru = 2, or ru = 3.
  2. Turn the knob to set the parameter to ru = 3.
  3. Wait for the text ru = 3 to clear from the display.

Now, on the first room unit, proceed as follows:
- Access the Engineer menu level, then the Configuration menu.
- Select parameter 6200 (Save sensors), set it to yes and confirm.

The value of parameter 6200 which displays at the end of the configuration procedure will still be no; this is normal (this setting executes an action, i.e. memorization of the actually installed sensors).

5.2 OPTIMIZING DHW SERVICE

Refer to Paragraph 5.2 of the System Controller Installation manual.

5.3 OPTIMIZING AUXILIARY BOILER MANAGEMENT

Refer to Paragraph 5.3 of the System Controller Installation manual.

6.1.1 Troubleshooting measures

A: Codes 10, 30, 32, 50

For codes 10, 30, 50 refer to Paragraph 6.1 of the System Controller Installation manual. For code 32, proceed as follows:

1. Memorize the sensors:
   - Access the Engineer menu level, then the Configuration menu; select parameter 6200 (Save sensors), set it to yes and confirm.

   The value of parameter 6200 which displays at the end of the configuration procedure will still be no; this is normal (this setting executes an action, i.e. memorization of the actually installed sensors).

   Wait for a minute.

2. If step 1 does not resolve the problem:
   - Check the connection of the sensor in question, correct it, and memorize the sensor again as indicated in step 1.

3. If step 2 does not resolve the problem:
   - Disconnect the sensor from the RV/S21.826 controller and measure the resistance between the cable’s two wires. If the measurement indicates a short or open circuit, identify and resolve the problem, which may be due to the sensor itself or its wiring. Once the problem has been resolved, reconnect the sensor and memorize it again as indicated in step 1.

4. If step 3 does not resolve the problem:
   - Access the Engineer menu level, then the Configuration menu; select parameter 6391 (Sensor input BX31); check that it is set to the value used by parameter 6455; if not, remaining in the Engineer menu level, Configuration menu, select parameter 6455 (Function mixing group 3) and set it to Heating circuit 2.

   Run sensor memorization again as indicated in step 1.

   ATTENTION: This sensor is used only in the presence of the mixed heating circuit 2, otherwise no sensor must be connected to input BX31. If a sensor is connected to this input by mistake, remove it, then run sensor memorization again as described in step 1.

5. If step 4 does not resolve the problem:
   - Power the system controller off and on again; if the problem persists, contact the Robur Technical Support Centre.

B: Codes 60, 65, 68

1. Memorize the sensors:
   - Access the Engineer menu level, then the Configuration menu; select parameter 6200 (Save sensors), set it to yes and confirm.

   Wait for a minute.

2. If step 1 does not resolve the problem:
   - Check the communications between the controller and the room unit/s and their configuration (see par. 5.1.7 p. 19). Resolve the problem, then run sensor memorization again as indicated in step 1.

3. If step 2 does not resolve the problem:
   - Power the system controller off and on again; if the problem persists, contact the Robur Technical Support Centre.

C: Codes 83, 103

Refer to Paragraph 6.1 of the System Controller Installation manual.

D: Code 84

This problem occurs when multiple room units are connected and some of them are configured as the same type of device (e.g., two room units both as room unit 1).

1. Resolve the problem as indicated in par. 5.1.7 p. 19, Case 3, to configure the room units correctly.

2. If step 1 does not resolve the problem:
   - Power the system controller off and on again; if the problem persists, contact the Robur Technical Support Centre.

E: Code 127

Refer to Paragraph 6.1 of the System Controller Installation manual.

F: Code 324

This error is generated if two or more BX temperature sensors have been configured to a single function.

1. Check the configuration:
   - Access the Engineer menu level, then the Configuration menu, and select parameters:
     - 6014 (Function mixing group 1); set it to Multifunctional
     - 5930 (Sensor input BX1); check that it is set to Outside sensor B9; if not, set it to that value.
     - 5931 (Sensor input BX2); check that it is set to none; if not, set it to this value.
     - 5932 (Sensor input BX3); check that it is set to DHW sensor B3; if not, set it to this value.
     - 5933 (Sensor input BX4); set it to none.
Special operations and configurations

- 6014 (Function mixing group 1); set it to Heating circuit 1.
- 6455 (Function mixing group 3); set it to Multifunctional.
- 6391 (Sensor input BX31); check that it is set to none; if not, set it to this value.
- 6392 (Sensor input BX32); check that it is set to none; if not, set it to this value.
- 6393 (Sensor input BX33); check that it is set to none; if not, set it to this value.
- 6394 (Sensor input BX34); check that it is set to none; if not, set it to this value.
- 6455 (Function mixing group 3); set it to Heating circuit 2.

Run sensor memorization: access the Engineer menu level, then the Configuration menu; select parameter 6200 (Save sensors), set it to yes and confirm.

The value of parameter 6200 which displays at the end of the configuration procedure will still be no; this is normal (this setting executes an action, i.e. memorization of the actually installed sensors).

Wait for a minute.

1. Check the configuration:
   a. for code 441:
      - Access the Engineer menu level, then the Configuration menu; select parameter 6391 (Sensor input BX31); check that it is set to the value used by parameter 6455; if not, remaining in the Engineer menu level, Configuration menu, select parameter 6455 (Function mixing group 3) and set it to Heating circuit 2.
   b. for codes 442, 443, 444:
      - remove the sensor connected respectively to input BX32, BX33, BX34 (unassigned inputs).
      - Run sensor memorization: access the Engineer menu level, then the Configuration menu; select parameter 6200 (Save sensors), set it to yes and confirm.

The value of parameter 6200 which displays at the end of the configuration procedure will still be no; this is normal (this setting executes an action, i.e. memorization of the actually installed sensors).

Wait for a minute.

2. If step 1 does not resolve the problem:
   - Power the system controller off and on again; if the problem persists, contact the Robur Technical Support Centre.

G: Codes 330, 331, 332, 333, 441, 442, 443, 444
This problem is due to the physical presence of a sensor connected to one of inputs BX1, BX2, BX3, BX4, BX31, BX32, BX33, BX34, to which no function is assigned.
For codes 330, 331, 332, 333 refer to Paragraph 6.1 of the System Controller Installation manual. For codes 441, 442, 443, 444 proceed as follows:

7 SPECIAL OPERATIONS AND CONFIGURATIONS

Refer to section 7 of the system controller Installation manual.
APPENDIX A: TECHNICAL DATA

RVS21.826, QAA75.611, QAA55.110
